

1.

$$h(t, s) = \begin{cases} \gamma(2t) & t \leq \frac{1-s}{2} \\ \gamma(1-s) & t \in (\frac{1-s}{2}, \frac{1+s}{2}) \\ \bar{\gamma}(2(t - \frac{1}{2})) & t \geq \frac{1+s}{2} \end{cases}$$

□

2. ((iii)  $\implies$  (i)): Apply problem 3, in particular any element  $[f] \in \pi_1(X, x_0)$  satisfies

$$[f] = [\alpha][1_{x_0}][\alpha]^{-1} = [1_{x_0}]$$

((i)  $\implies$  (iii)): Apply problem 3, since there is only one conjugacy class of  $\pi_1(X, x_0)$  there is only one homotopy class  $S^1 \rightarrow X$ . Alternatively, let  $f_1, f_2 : S^1 \rightarrow X$ , where we parameterize  $S^1$  as  $\frac{I}{0 \sim 1}$ , since  $X$  is path connected, there is some path  $\gamma : I \rightarrow X$  with  $\gamma(0) = f_1(0)$  and  $\gamma(1) = f_2(0)$ , then by assumption (i),  $[f_1] = [1_{f_1(0)}]$  and  $[f_2] = [1_{f_2(0)}]$ , now we can write the homotopy between  $1_{f_1(0)} \sim f_1$  and  $1_{f_2(0)} \sim f_2$ , which is given by  $h(s, t) = \gamma(s)$ . □

((ii)  $\implies$  (i)): Let  $[\gamma] \in \pi_1(X, x_0)$  for some  $x_0 \in X$ , then we can define new paths

$$\gamma_1 : t \mapsto \gamma(t/2) \quad \gamma_2 : t \mapsto \gamma\left(\frac{1+t}{2}\right)$$

then  $\bar{\gamma}_1$  and  $\gamma_2$  satisfy the hypotheses of (ii), which entails  $\gamma_2 \sim \bar{\gamma}_1$ , now since  $\gamma = \gamma_1 \cdot \gamma_2$  we find that  $\gamma \sim \gamma_1 \cdot \bar{\gamma}_1 \sim 1_{x_0}$ , whence  $[\gamma] = [1_{x_0}]$ . Since  $[\gamma]$  was arbitrary we conclude  $\pi_1(X, x_0) = 0$ . □

((i)  $\implies$  (ii)): Let  $f, g : I \rightarrow X$  with  $x = f(0) = g(0)$  and  $y = f(1) = g(1)$ , then from (i) we get a homotopy  $h$  witnessing  $f\bar{g} \sim 1_x$ , moreover there is some homotopy  $r$  giving  $\bar{g}g \sim 1_y$  satisfying  $h(1, s) = h(0, s) = x$  for all  $s$ , and  $r(1, s) = r(0, s) = y$  for all  $s$ . It is clearly sufficient to provide some path  $\gamma$  such that  $f$  is homotopic to  $\gamma$  by  $h'$  without moving endpoints, and same for  $g$  by  $h''$ , since then the following homotopy satisfies the desideratum

$$H(t, s) = \begin{cases} h'(t, 2s) & s \in [0, \frac{1}{2}] \\ h''(1-t, 1-2(s-\frac{1}{2})) & s \in (\frac{1}{2}, 1] \end{cases}$$

Taking  $\gamma = f\bar{g}g$ , we find that  $h'$  can be taken to be

$$h'(t, s) = \begin{cases} h(2t, s) & t \in [0, \frac{1}{2}] \\ g(2(t-\frac{1}{2})) & t \in (\frac{1}{2}, 1] \end{cases}$$

and  $h''$  can be taken to be

$$h''(t, s) = \begin{cases} f(2t) & t \in [0, \frac{1}{2}] \\ r(s, 2(t-\frac{1}{2})) & t \in (\frac{1}{2}, 1] \end{cases}$$

□

3. Define the map

$$\begin{aligned} \psi : \pi_1(X, x_0) &\rightarrow \{S^1 \rightarrow X\} / \sim \\ [f] &\mapsto [f] \end{aligned}$$

In words, we forget the base point of  $f$ . This is of course well defined up to homotopy. To check it is well defined on conjugacy classes, it suffices to check that  $[f] = [\alpha][f][\alpha]^{-1}$  for arbitrary  $f$  and  $\alpha$ . This is straightforward by choosing the representative with  $\alpha$ ,  $f$  and  $\bar{\alpha}$  each being sped up by 3 times, and defining the homotopy

$$h(t, s) = \begin{cases} \alpha(s+3t) & t \leq \frac{1-s}{3} \\ f\left(\frac{t-\frac{1-s}{3}}{1-2\frac{1-s}{3}}\right) & t \in (\frac{1-s}{3}, \frac{2+s}{3}) \\ \alpha(1+s-3(t-\frac{2}{3})) & t \geq \frac{2+s}{3} \end{cases}$$

To see that this map is onto, it suffices to check that every map  $f : S^1 \rightarrow X$  is homotopic to a map  $f'$  with  $f'(0) = x_0$ . Now checking this consider some  $f : S^1 \rightarrow X$ , and let  $\gamma$  be a path between  $x_0$  and  $f(0)$ , then we can write

$$f'(t) = \begin{cases} \gamma(3t) & t \leq \frac{1}{3} \\ f(3(t - \frac{1}{3})) & t \in (\frac{1}{3}, \frac{2}{3}) \\ \gamma(1 - 3(t - \frac{2}{3})) & t \geq \frac{2}{3} \end{cases}$$

Then we can verify explicitly that  $f' \sim f$

$$h'(t, s) = \begin{cases} \gamma(s + 3t) & t \leq \frac{1-s}{3} \\ f(\frac{t - \frac{1-s}{3}}{1 - 2\frac{1-s}{3}}) & t \in (\frac{1-s}{3}, \frac{2+s}{3}) \\ \gamma(1 + s - 3(t - \frac{2}{3})) & t \geq \frac{2+s}{3} \end{cases}$$

Finally, we need to check injectivity. Assume that  $\psi([f]) = \psi([g])$ , then there is some homotopy  $h : S^1 \times I \rightarrow X$  witnessing this equivalence, then we can define  $\alpha(s) = h(0, s) = h(1, s)$ . It remains to check that  $[\alpha][f][\alpha]^{-1} = [g]$ , this equivalence is given by the following (based) homotopy between  $[\alpha][f][\alpha]^{-1}$  and  $[1_{x_0}][f][1_{x_0}] = [f]$ .

$$H(t, s) = \begin{cases} h(0, 3(1-s)t) & t \leq \frac{1}{3} \\ h(3(t - \frac{1}{3}), 1-s) & t \in (\frac{1}{3}, \frac{2}{3}) \\ h(1, (1-s) - 3(1-s)(t - \frac{2}{3})) & t \geq \frac{2}{3} \end{cases}$$

□
